- 1) The most difficult part for me was closing the about menu. I overthought what I did to do and tried to create an event listener for the button even though I did not need to. I then read the code closely for the javascript and the html and realized that I did not need that. Understanding all the different class names and ids was a little bit confusing but once I understood it, it was easy to do with the code you had to open up the about menu.
- 2) Changing the positioning of the x was fairly straight forward with some googling. I first tried to mess with the css code but that was not working so I just used "position:relative; top:-20px" in the html style code for the x and that worked.

For the javascript to close x:

```
document.getElementById("modalClose").onclick = function() {  
    document.getElementById("aboutModal").style.display =  
    "none";  
};
```

For changing the x:

```
<button id="modalClose" class="close"  
    style="border: 4px solid black;  
    background-color: black; color: white;  
position:relative; top:-20px">  
    &times;</button>
```
